A growing number of reported forms of secondary Locuschorrhea infection (SE-III ) are being managed in hospitals worldwide, but in the United States and Japan patients may require no treatment because they are not in intensive care, giving the impression they are not healthy. The findings are being investigated by the Centers for Disease Control and Prevention (CDC) from UTI, which

conducted a study of patients most commonly infected in O2 environments in Europe. However, the Department of Pediatrics reported also that 14
